**The chemistry of computing**  
*Computers made of molecule-size parts could build themselves*

U.S. NEWS & WORLD REPORT, MAY 1, 2000

**A supercomputer shrunk to a speck?**  
*Future computers could be made of switches and wires no bigger than single molecules.*

**A switch molecule**  
One switch now under development is a single molecule that would flip "on" or "off" when an electric charge triggers a ring structure to slide up or down.

**Putting it all together**  
Molecular switches might be connected by metal wires just 10 atoms across, like the one shown in the micrograph below.

**Electronically Configurable Molecular-Based Logic Gates**

C. P. Collier, E. W. Wong, M. Belohradský, F. M. Raymo, J. F. Stoddart, P. J. Kuekes, R. S. Williams, and J. R. Heath, Science 1999 July 16; 285: 391-394.

### Summary/conclusions/cautions

- many devices/architectures under study
- nanodevices have a long way to go
- many practical problems which cannot be ignored
