

Example of Sort-Merge Join							
				sid	bid	day	rname
<u>sid</u> 22 28 31 44 58	sname dustin yuppy lubber guppy rusty	rating 7 9 8 5 10	age 45.0 35.0 55.5 35.0 35.0	28 28 31 31 31 58	103 103 101 102 101 103	12/4/96 11/3/96 10/10/96 10/12/96 10/11/96 11/12/96	guppy yuppy dustin lubber lubber dustin
 Cost: Sort R + Sort S + (M+N) The cost of scanning, M+N, could be M*N (very unlikely!) With 35, 100 or 300 buffer pages, both Reserves and Sailors can be sorted in 2 passes; total join cost: 7500. (BNL cost: 2500 to 15000 I/Os) 							

Set Operations

- Intersection and cross-product special cases of join.
- Union (Distinct) and Except similar; we'll do union.
- Sorting based approach to union:
 - Sort both relations (on combination of all attributes).
 - Scan sorted relations and merge them.
 - Alternative: Merge runs from Pass 0 for both relations.
- Hash based approach to union:
 - Partition R and S using hash function h.
 - For each S-partition, build in-memory hash table (using *h2*), scan corr. R-partition and add tuples to table while discarding duplicates.

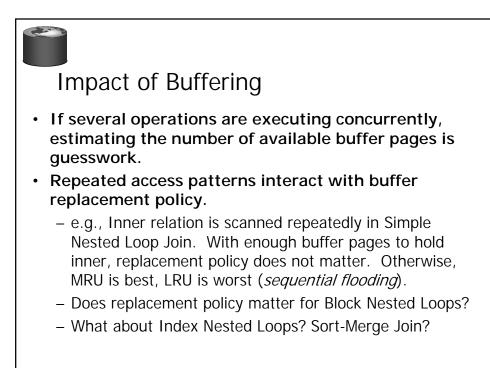

Aggregate Operations (AVG, MIN, etc.)

Without grouping:

- In general, requires scanning the relation.
- Given index whose search key includes all attributes in the SELECT or WHERE clauses, can do index-only scan.

With grouping:

- Sort on group-by attributes, then scan relation and compute aggregate for each group. (Can improve upon this by combining sorting and aggregate computation.)
- Similar approach based on hashing on group-by attributes.
- Given tree index whose search key includes all attributes in SELECT, WHERE and GROUP BY clauses, can do index-only scan; if group-by attributes form prefix of search key, can retrieve data entries/tuples in group-by order.

Summary

- A virtue of relational DBMSs: *queries are composed of a few basic operators*; the implementation of these operators can be carefully tuned (and it is important to do this!).
- Many alternative implementation techniques for each operator; no universally superior technique for most operators.
- Must consider available alternatives for each operation in a query and choose best one based on system statistics, etc. This is part of the broader task of optimizing a query composed of several ops.
